HYDRAULIC RELEASE SHACKLES RENTAL

IQIP offers hydraulic release shackles ranging from 25 to 2,000 tonnes that are suitable for water depths of 500 to 3,000m. These are used to install and decommission on/offshore structures by allowing the remote release and engagement of lift rigging from structures being raised. Over the past 30 years, our shackles have been used on projects all over the world, and have an extensive track record.

IQIP's standard range of release shackles have hydraulic umbilical connectivity. They can also be customised to include ROV-friendly solutions with the capacity to store hydraulic energy during subsea operations. All of our equipment has been designed with contingency and functionality in mind, which ensures that you are able to release any load safely.

Our units can be equipped with the following options:

- ROV ball valve – activates an accumulator package that utilises stored hydraulic energy
- hot stab receptacle – suitable during subsea operations for ROV intervention
- pressure gauge – monitors hydraulic operations
- hydraulic accumulator – can be used as the primary or secondary method for releasing or engaging
- additional secondary hydraulic cylinder – for contingency operations
- ROV grab bar – features a user-friendly interface and ideal for ROV stabilisation.

Please contact IQIP's Sales department for further information as special configurations can also be arranged.
